

EASTERN UNIVERSITY, SRILANKA

FIRST YEAR FIRST SEMESTER EXAMINATION IN AGRICULTURE 2008/2009

(March/April 2010)

AEN 1101 – APPLIED MECHANICS (1:15/00)

Answer all questions

Time : 01 Hour

01. (a) State the laws of friction
(b) Write down the three forms of mechanical energy with suitable equations.
02. A horizontal beam ABCDEF is 2.5m long and $AB=BC=CD=DE=EF=0.5m$. The ends rest on broad supports, giving uniformly distributed reactions over AB and EF. A concentrated load of 2000 N acts at C, and 1000 N at D. In addition, a uniformly distributed load of 6000 N extends over the length CE as shown below.

- (i) Calculate the reaction at each support. (Assume that the reaction at either end acts through the midpoint of the supporting length)
- (ii) Calculate the shear forces and draw the shear force diagram.
- (iii) Calculate the bending moments and draw the bending moment diagram

(PTO)

03. (a) Define young's modulus of elasticity and strain energy.
- (b) When a 300 kg mass is suspended from a steel wire of length 2 m and area 1.96 its length increases. The temperature of the wire after loading was found to be Young's modulus of steel is $2 \times 10^{11} \text{ Nm}^{-2}$. If the coefficient of linear expansion of is $1.1 \times 10^{-5} \text{ C}^{-1}$, Find;
- The stress in the system
 - The strain
 - Increase in length of the steel wire
 - Elastic potential energy stored in the wire
 - Tension in the wire in the loaded position
 - The change in tension of the wire, when the loaded wire is allowed to cool 30°C to 26°C .
